1.1 Problem Domain

1.2 Existing Systems

2 User Stories

2.1 Product Backlog

The 29 user stories which make up the product backlog were grouped into three categories as described in the sections below.

Backlog 29 issues

<div style="text-align: right">**Create sprint** ...</div>

As a listener, I want to be able to use keywords to search for podcasts, so I can find podcasts that interest me	UL-2 ↑	5
As a listener, I want to be able to see the total number of subscribers for each podcast returned from searches, so I can see how popular they are	UL-3 ↑	1
As a listener, I want to be able to view the title, description, author details and list of episodes for a podcast, so I can see if it matches my interests	UL-4 ↑	3
As a listener, I want to be able play episodes, so I can listen to them	UL-5 ↑	1
As a listener, I want episodes I've started playing to be marked as played, so I can keep track of what I have already listened to	UL-6 ↑	1
As a listener, I want to be able to subscribe to a podcast, so I can keep up to date with podcasts that interest me	UL-7 ↑	1
As a listener, I want to be able to unsubscribe to a podcast, so I can stop following podcasts that no longer interest me	UL-8 ↑	1
As a listener, I want to be able to see the latest episode for each subscribed podcast in a "Podcast Subscription Preview" panel, so I can easily keep up to date with the podcasts I am interested in	UL-30 ↑	3
As a listener, I want to receive a notification when a new episode for a podcast I am subscribed to is released, so I can keep up to date with episodes that interest me	UL-9 ↑	1
As a listener, I want to be able to view my podcast episode history, so I can review what I have listened to	UL-10 ↑	3
As a listener, I want to be able to sort by most recently played for my episode history, so that I can more easily find episodes I have listened to previously	UL-11 ↑	1
As a listener, I want to be recommended to new podcasts, so I can more easily find new podcasts that interest me	UL-12 ↑	1
As a listener, I want recommended podcasts to be based on my existing subscriptions, recently played episodes and past searches, so there is a greater chance I will find a podcast that interests me	UL-13 ↑	9
As a user, I want to be able to login, so that I have a custom experience and can be identified	UL-14 ↑	5
As a content creator, I want to be able to create podcasts, so I can publish episodes under a common group	UL-15 ↑	3
As a content creator, I want to be able to delete podcasts, so I can remove podcasts and episodes within	UL-16 ↑	1
As a content creator, I want to be able to update podcasts, so I can easily add or remove podcast content	UL-17 ↑	3
As a listener, I want to be able to pause episodes, so I can resume a podcast later when it suits me	UL-18 ↑	1
As a listener, I want to be able to adjust the volume of episodes, so I can keep volume at a level different to other apps/programs	UL-19 ↑	1
As a listener, I want to be able to skip to the next, previous episode as well as the start of the current episode, so I can easily navigate between episodes	UL-20 ↑	1
As a listener, I want to be able to jump to a particular point in an episode, so I can easily navigate within an episode	UL-21 ↑	1
As a listener, I want to be able to adjust playback speed, so I can listen to episodes at a pace that suits me	UL-22 ↑	1
As a listener, I want to be able to auto-play episodes within a podcast, so I can easily listen to episodes sequentially	UL-23 ↑	1
As a listener, I want to be able to view a title, length, upload date and progress for episodes, so I have a better idea of what to expect before listening	UL-24 ↑	3
As a listener, I want closed captions to be available, so I can understand what is being said if audio is an issue	UL-25 ↑	3
As a listener, I want to be able to "bookmark" points in episodes, with a title and short description and view bookmarks on a separate page, so I can track of points of interest	UL-26 ↑	5
As a content creator, I want to be able to view episode and podcast metrics; plays, subscribers viewer location, viewer age, so I can better tailor my content	UL-27 ↑	5
As a listener, I want to be able to follow friends, so I can see what they are listening to	UL-28 ↑	3
As a listener, I want to be able to save previous searches as "streams", so I can avoid searching for the same thing multiple times	UL-29 ↑	3

Figure 2: UltraCast Backlog [**?**]

2.1.1 Project Objectives Stories

The project objective stories were derived directly from the project objectives. The mapping of each objective to the final user story was summarised in Table XXX.

TODO format below as table

Listeners must be able to search for podcasts that interest them by keywords, resulting in a list of matching podcast titles, where the total number of subscriptions on the ultraCast platform (function described later) for each podcast is shown next to the title.

2.1.2 System Stories

The system stories were designed to address common features offered by existing offerings in the same problem domain. They can be seen in Figure XXX below.

TODO add figure of system stories

2.1.3 Novel Features Stories

The novel feature stories were designed to create desirable features that are either uncommon or not available in other mainstream offerings in the same problem domain.

TODO stories + reason for being unique

2.2 Sprints

3 Interface and Flow Diagrams

4 System Architecture

The proposed system architecture can be seen in Figure 2. First, we will use MongoDB to store our data, a NoSQL database that is popular for its high scalability. This service will be interfaced with the MongoDB-Python driver, available on the MongoDB website. Next, we will be using Flask for our web-server: a micro-framework that allows us to quickly develop an MVP solution. Flask is written in Python, so connecting to the database via the MongoDB-Python driver should be straightforward. Additionally, we will have a recommendation service that will generate recommended podcasts based on the users listening history. Finally, we will have a React frontend application that will enable our users to login, search and play podcasts, and get recommendations on ones they may be interested in. The React application and Flask application will communicate through a GraphQL API: a scalable alternative to the popular REST API.

The architecture has been designed with the final demonstration in mind, hence, the business and presentation layers are shown to be hosted on the VLab machine. Currently, MongoDB is not supported by Debian 6 (the Linux environment on the VLab machine), so we have opted to put the data layer onto an AWS EC2 instance.
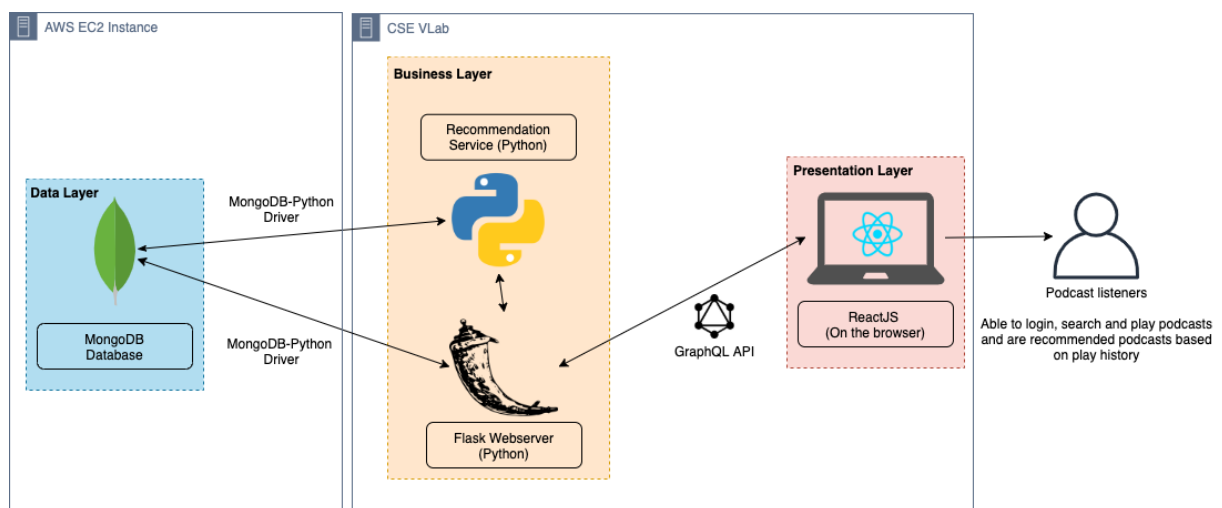

Figure 3: Proposed System Architecture
